www.thepragmaticsteward.com

2

Sidebar – gsf, EUI, source energy

- gross square footage (gsf)
- total building floor area

For most houses, climate dominates
→ energy use (surface effect)

For commercial buildings E dominated by
→ internal loads (E scales with volume)

Energy Use Intensity $EUI = \frac{(\text{annual energy used})}{(\text{total gsf})}$

energy flows:

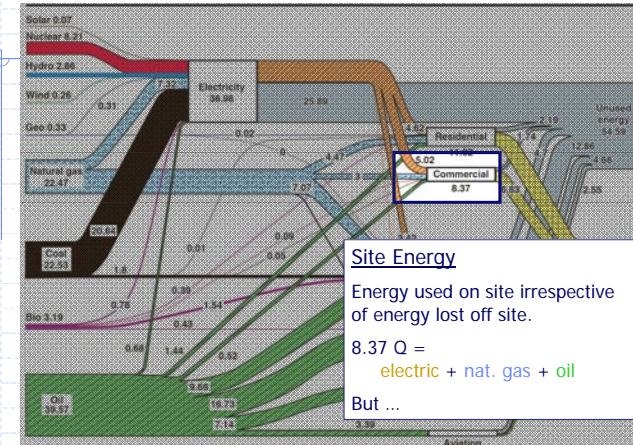

electric, natural gas, district steam
district hot water, home heating oil
chilled water, etc.

11

Estimated Energy Usage in 2006 ~97.1 Quads

October 20, 2014

www.thepragmaticsteward.com

12

Source Energy

$$\text{Source Energy} = 3 (\text{Electric Energy}) + (\text{non-Electric Energy})$$

- Building source energy correlates with primary energy use, energy cost (\$), and GHG emission
- EPA uses source energy for Building *ENERGY STAR* scores
- Commercial buildings use 8.4Q site energy, 18.4 source energy

To adjust for building size we look at energy intensity. For all U.S. commercial buildings:

Site energy intensity = 91 kBtu/sf

Source energy intensity = 190 kBtu/sf

14

Energy Efficiency potential for buildings

- R&D in energy efficiency goes back to 1973 *Arab Oil Embargo*
- Numerous studies going back to the 70's demonstrate building energy can be reduced 30-50% using existing, cost-effective EE technologies
- Bottom fell out of oil market in mid-80's
- From 1970 – 2000 little success in lowering US building energy use
- In 2008 the *American Physical Society (APS)* published a study affirming the role of efficiency in buildings (Scofield coauthor of report)

15

US Green Building Council LEED rating

- **L**eadership in **E**nergy & **E**nvironmental **D**esign
- Green building rating introduced in 1998 by USGBC
- Goal is to promote sustainable building practices
- The **N**atural **R**esources **D**efense **C**ouncil writes:

The LEED green-building rating system ... is designed to promote design and construction practices that increase profitability while reducing the negative environmental impacts of buildings and improving occupant health and well-being.

Intent of LEED – to save energy, reduce GHG emission, and lower environmental impact

LEED brought "sex-appeal" to energy efficiency

October 20, 2014

www.thepragmaticsteward.com

16

- constantly being updated – now on version 4
- many different systems:
new construction (NC), core & shell (CS), schools (schools), existing buildings, operation and maintenance (EB:OM), etc.
- level of certification depends on points earned
certified (40), silver (50), gold (60), platinum (70) of 110
- Point categories:
location/transportation, sustainable sites, water eff., energy & atmosphere, material & resources, indoor env. quality, innovation, regional priority

17

Credit: Enhanced refrigerant management	1		

- largest category – 33 pts possible
- no performance requirement (except EB:OM)
- For NC points determined by energy “projections”

$$EER = \frac{\text{simulated design energy}}{\text{simulated baseline model energy}}$$

more points awarded for lower EER

- For EB:OM points determined by ENERGY STAR score
higher the score the more points awarded for EE
- For v.3 (v2009) added requirement to monitor annual energy use
and report to USGBC for five years

Energy and GHG savings only part of LEED – but it is the **first** part – w/o it no one would care

19

LEED proponents claim significant savings in energy and lowering of green house gas emission

Green Schools

Celebrating Schools

The Green Schools program at OFCC has been in existence since September 2007, when the Commission adopted LEED for Schools as the standard for K-12 school projects. The LEED for Schools Rating System is a comprehensive tool that looks at design and construction practices including classroom acoustics, indoor air quality, selection of building materials and energy efficiency.

The system is based on prerequisites and credits that address seven areas: sustainable sites, water efficiency, energy and atmosphere, materials and resources, indoor environmental quality, innovation in design and regional priority.

Once design and construction for a building are complete, its systems have been tested, and it has met LEED standards, a project is eligible for one of four levels of recognition based on the number of credits obtained: Certified, Silver, Gold or Platinum.

MIDWEST ENERGY NEWS

HOME NEWS OPINION ABOUT DONATE

In Ohio, schools reap benefits of energy-efficiency push

Posted on 10/29/2013 by Katherine M. Kowalski

Ohio leads the nation in energy-efficient LEED schools, saving millions of dollars on energy costs annually. And energy-efficient districts are helping voters appreciate these financial benefits as they make their cases for levy approvals.

The state's top push is in large part because of the Ohio School Facilities Commission's (OSFC) adoption of the Leadership in Energy and Environmental Design for Schools rating program, developed by the U.S. Green Building Council, applies to new construction or major renovations for schools from kindergarten through twelfth grade.

"Ohio is leading the nation in our green school efforts. We're even beating California," says Lisa Lavin, green schools program director for OSFC. As of April 2013, Ohio had 242 schools either certified or registered for certification, compared to just 101 in California, according to OSFC data.

"Every district that we're currently working with is expected to design their building with an eye to earning LEED silver certification," OSFC spokesman Rob Delane adds. Schools don't have to stop at silver. The top Ohio schools certified so far include three at the platinum level, 21 with gold certification, 23 with silver certification, and one plus certification.

The law doesn't require all new school projects to go through OSFC. For those that do, projects get no funding from the state, and OSFC boosts the budget 3 percent to cover LEED certification. State and local shares vary, based on a funding formula that considers local property values.

"These green schools average about a third less energy use in wattage than traditional schools," notes Rob Delane, deputy executive director at the Ohio School Boards Association. Depending on a school's size, savings "could be upwards of \$100,000 per year."

Energy savings claims are based on design simulations – not on measured energy performance

October 20, 2014

www.thepragmaticsteward.com

25

Documented gap between energy simulations and measured performance

Johnson, J. 2002, "Is What They Want What They Get? Examining Field Evidence for Links between Design Intent and As-Built Energy Performance of Commercial Buildings." In *Proceedings of the 2002 ACEEE Summer Study on Energy Efficiency in Buildings*, 4:161-170. Washington, D.C. American Council for an Energy-Efficient Economy.

J. L. Barrientos Sacari, U. Bhattacharjee, T. Martinez and J. J. Duffy, "Green Buildings in Massachusetts: Comparison Between Actual and Predicted Energy Performance," *Proceedings of the American Solar Energy Society*, Cleveland, OH, July 9-13, 2007.

Cathy Turner Mark Frankel, "Energy Performance of LEED for New Construction Buildings—Final Report," *New Buildings Institute*, White Salmon, WA, 2008.

- Sacari et al. found measured EUI, on average, to be 40% higher than predicted EUI for green buildings.
- NBI found limited correlation between predicted EUI and measured EUI for LEED buildings.

32

Energy Performance of LEED for New Construction

Turner & Frenkel, New Buildings Institute

"...on average, LEED buildings are delivering anticipated savings. Each of three views of building performance show average LEED energy use 25-30% better than the national average, a level similar to that anticipated by LEED modeling."

October 20, 2014

www.thepragmaticsteward.com

33

NBI LEED Study

- Long assumed that LEED buildings are energy-efficient
- Until 2007 little empirical data to support this
- USGBC engaged the *New Buildings Institute* to conduct a broad study of energy consumption by LEED commercial buildings
- NBI gathered energy consumption data volunteered by 121 of the 552 commercial buildings certified from 2000-6 under NcV2
- March 2008 NBI issued final report which concludes LEED buildings, on average, achieve 25-30% energy savings
- Study immediately drew criticism (e.g., Henry Gifford) for comparing **medians** with **means**
- Cathy Turner (NBI) made summary LEED data available for independent analysis

2007-8 study chaired by Burt Richter (Stanford) – Nobel laureate

Re: the NBI LEED building study

"Whatever their efficiency, these 121 LEED buildings consume more total energy per square foot (either site or primary) than the average for the entire commercial building stock."

Scofield analysis of LEED building energy data

Re-evaluation of the NBI LEED Energy Consumption Study

Proceedings of the *International Energy Program Evaluation Conference (IEPEC)*, Portland, OR, April 12-15, 2009

- NBI Study contained mathematical errors and inconsistencies
- LEED buildings used 10-15% less site energy than comparable non-LEED buildings
- LEED buildings demonstrated no savings in source energy

Energy and Buildings, 41, 1386-1390 (2009).

- Subsequent peer-reviewed studies confirm my results
- All these studies rely on data volunteered by willing building owners – self-selected data that skews results (Gifford – voluntary breathalyzer tests)
- These 252 buildings represent just 2% of the 11,000 eligible LEED-certified buildings

38

What about the energy data collected since 2009 by the USGBC?

Should have data from nearly 2000 buildings, nearly 10X the number of buildings collectively contained in other studies.

39

USGBC puts out marketing literature with energy savings claims, dated October 21, 2013

BY THE NUMBERS

An analysis of LEED projects that reported data over the 12-month period between July 2012 and July 2013 showed the following:

450 LEED projects showed they experienced an Energy Use Intensity (EUI) that was nearly 31% lower than the national median source EUI.

404 LEED projects indicated an ENERGY STAR score of 85, well above the level required for "Top Performers."

LEED buildings report diverting 57% of their non-construction waste (on average) from landfill, based on an analysis of waste diversion data for 316 LEED projects.

"Of 1,861 LEED Projects (representing MPR6 compliant commercial buildings in various rating systems) we are able to report performance data for:

- 450 buildings reporting energy data that is converted into source energy use intensity by ENERGY STAR.
- 404 buildings reporting energy data that are eligible for an ENERGY STAR score.
- This means that we have 1,411 buildings complying with MPR6, but not all of them are reporting data regularly or are certified yet.

- USGBC received energy data from 1,861 MPR6-compliant buildings
- 450 of these (24%) "showed they experienced" a source EUI that was 31% lower than national median
- The mean ENERGY STAR score for 404 buildings was 85
- These are meaningless sound bites!

Energy Benchmarking Laws in major US cities are "lifting the veil."

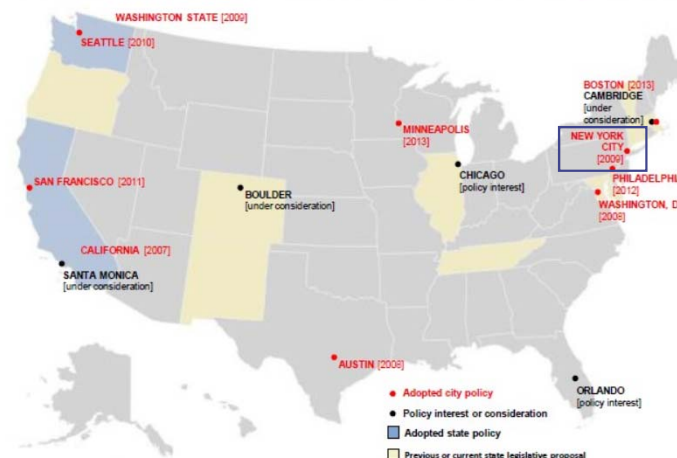

Soon building energy data will be made public for hundreds – even thousands of LEED-certified buildings.

New York City's First Benchmarking Scores for Non-Residential Covered Properties

On September 4, 2012, New York City publicly posted the 2011 energy and water benchmarking results for non-residential properties covered under the benchmarking ordinance (Local Law 84). The list was updated on September 24th to account for discrepancies in building identification. Please make sure you are using the most up-to-date list. Also note that buildings were determined as non-residential by the New York City Department of Finance (DOF).

Scofield analysis of NYC LEED Office Buildings

Efficacy of LEED-certification in reducing energy consumption and greenhouse gas emission for large New York City office buildings

Energy and Buildings, Vol. 67, 517-524 (December 2013).

- Identified 23 NYC LEED-certified office buildings
- Compared their energy performance to those of 953 NYC office buildings
- On average LEED offices showed no reduction in energy use or GHG emission
- LEED offices generally earned higher ENERGY STAR scores (by 10 pts)

Energy performance research [edit]

On average, LEED-certified buildings use the same source energy and produce equal greenhouse gas emissions as non-LEED-certified buildings.^[9] They use between 11 and 39% less site energy than non-LEED buildings on average, although 28-35% use more energy.^{[9][32]} No correlation was found between the number of LEED points achieved and measured energy savings.^{[32][33]}

Diamond et al. in 2006 compared modeled and actual building energy performance of 21 LEED-certified buildings (all certified under LEED-NC version 2.0 or 2.1).^[34] They found no correlation between the number of LEED energy-efficiency points achieved and actual energy savings demonstrated by post-occupancy data.^[34] The authors noted several limitations of the study, including the small sample size, uncertainties in actual floor area, and discrepancies between metered data.^[34]

In 2009 Newsham et al. analyzed a database of 100 LEED-certified buildings.^[35] In this study, each building was paired with a conventional "twin" building within the Commercial Building Energy Consumption Survey (CBECS) database according to building type and occupancy.^[35] On average, LEED buildings consumed 18 to 39% less energy than their conventional "twin" building, although 28 to 35% of LEED-certified buildings used more energy than their "twin."^[35] The paper found no correlation between the number of energy points achieved or LEED certification level and measured building performance.^[35] The authors noted that the studies were limited by the fact that most LEED buildings are newly constructed and may still be experiencing unexpected problems with systems operations, as well as other characteristics that commonly vary across individual buildings of the same type (plug loads, occupancy hours, construction differences, etc.).^[35]

In 2009 Scofield published an article in response to Newsham et al., analyzing the same database of LEED buildings and arriving at different conclusions.^[31] In his analysis, Scofield considered source energy (accounting for energy losses during generation and transmission) as well as site energy, and used area-weighted energy use intensities, or EUIs (energy per unit area per year), when comparing LEED and non-LEED buildings to account for the fact that larger buildings tend to have larger EUIs.^[31] Scofield concluded that, collectively, the LEED-certified buildings showed no significant source energy consumption savings or greenhouse gas emission reductions when compared to non-LEED buildings, although they did consume 10-17% less site energy.^[31] Scofield in 2013 analyzed 21 LEED-certified buildings in New York City.^[36] He found that buildings that had achieved LEED Gold used, on average, 20% less source energy than did conventional buildings. Buildings with LEED Silver or LEED Certified ratings actually used 11 to 15% more source energy, on average, than did their conventional counterparts.^[36]

Wrap Up

- LEED buildings have captured public's imagination
 - increased interest in sustainable practices
 - is leading to better buildings
- But there is little evidence that, on average, LEED-certification is actually saving primary energy or lowering greenhouse gas emission
- Claims of 30-50% energy savings are based on faith not science
- LEED certification adds real costs to building design & construction
- There is insufficient justification for governments to require that buildings be LEED certified
- LEED does deliver green publicity and green image
- Time to abandon green labels and seek green substance
- I look forward to the day when performance data show energy savings
